

User Interface Beaming

Seamless Interaction with Smart Things using Personal Wearable Computers

Simon Mayer, Gábor Sörös

Glass and Eyewear Computing 2014, Zürich, Switzerland

Interaction with Smart Things

- **Select** devices using object recognition technologies
- **Interact** with devices using appropriate user interfaces

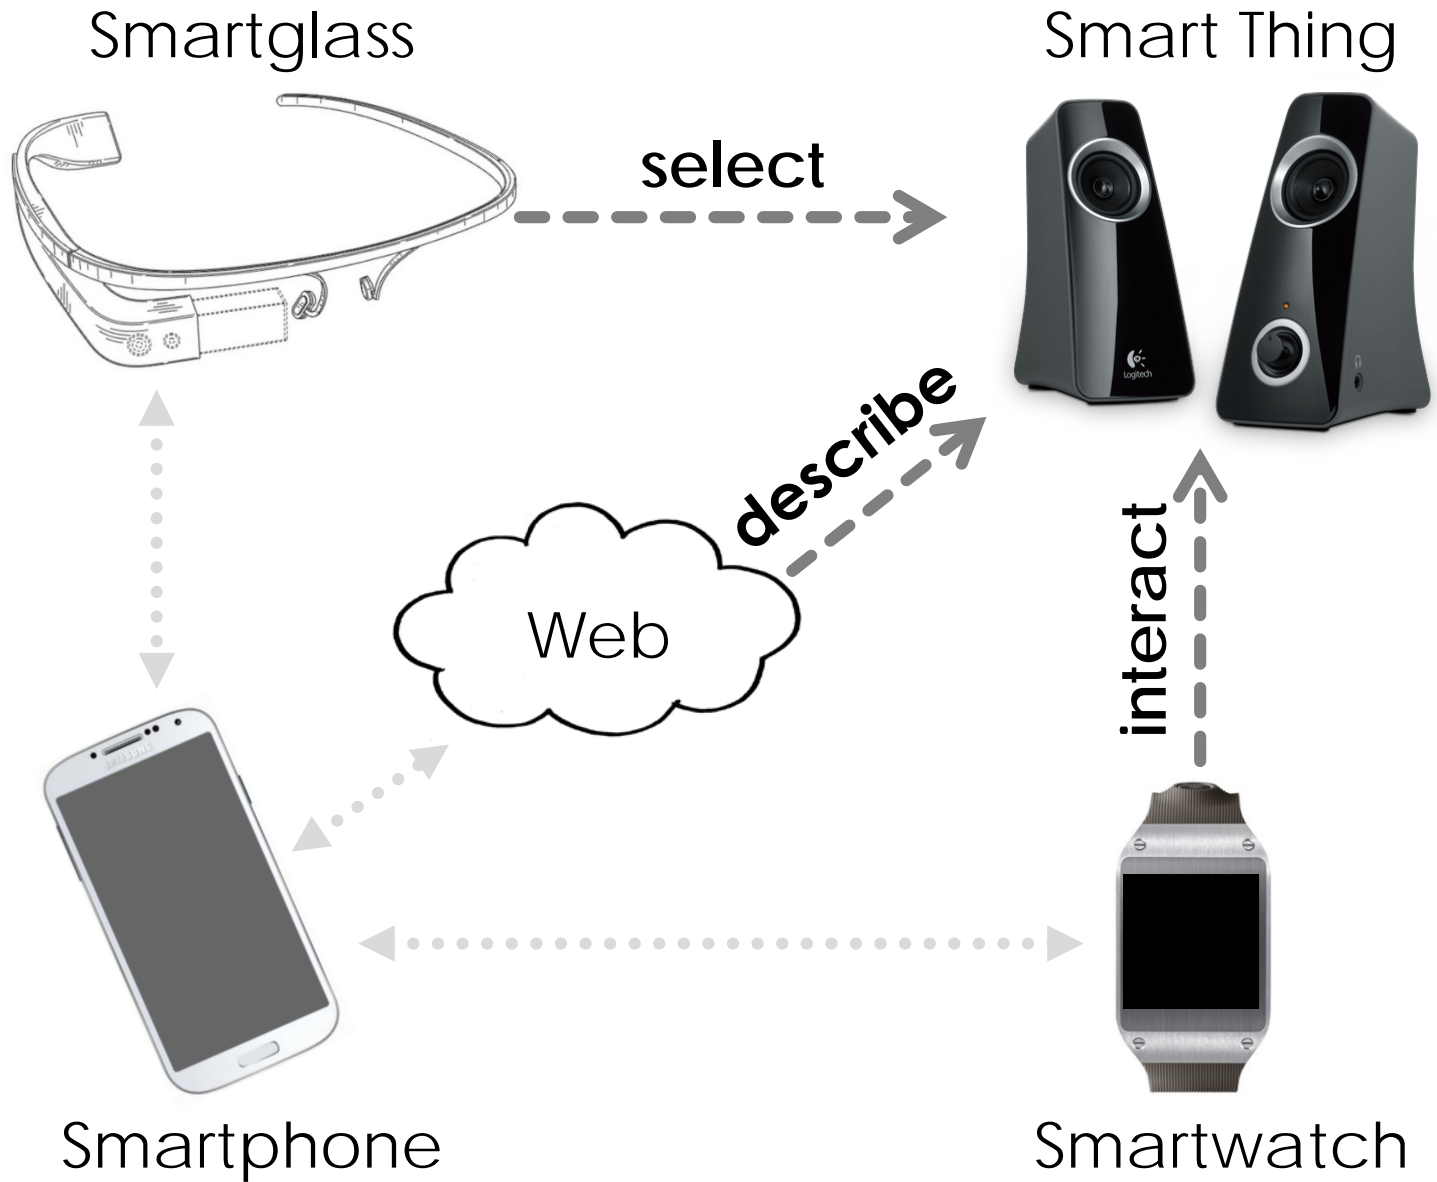

- **Combine personal wearables for convenient interaction**

Simon Mayer, Markus Schalch, Marian George, Gábor Sörös: *Device Recognition for Multiple Interaction with the Web of Things*, Ubicomp 2015

Combining Personal Wearables

Smartglass

select

Smart Thing

Interaction with Smart Things: Selection

- Glass: Same viewpoint as user!
- Visual object recognition
 - About 10 snapshots per device, can differentiate 8 devices
 - No tagging/fiducial markers required!
- Classification
 - SURF feature detection + description

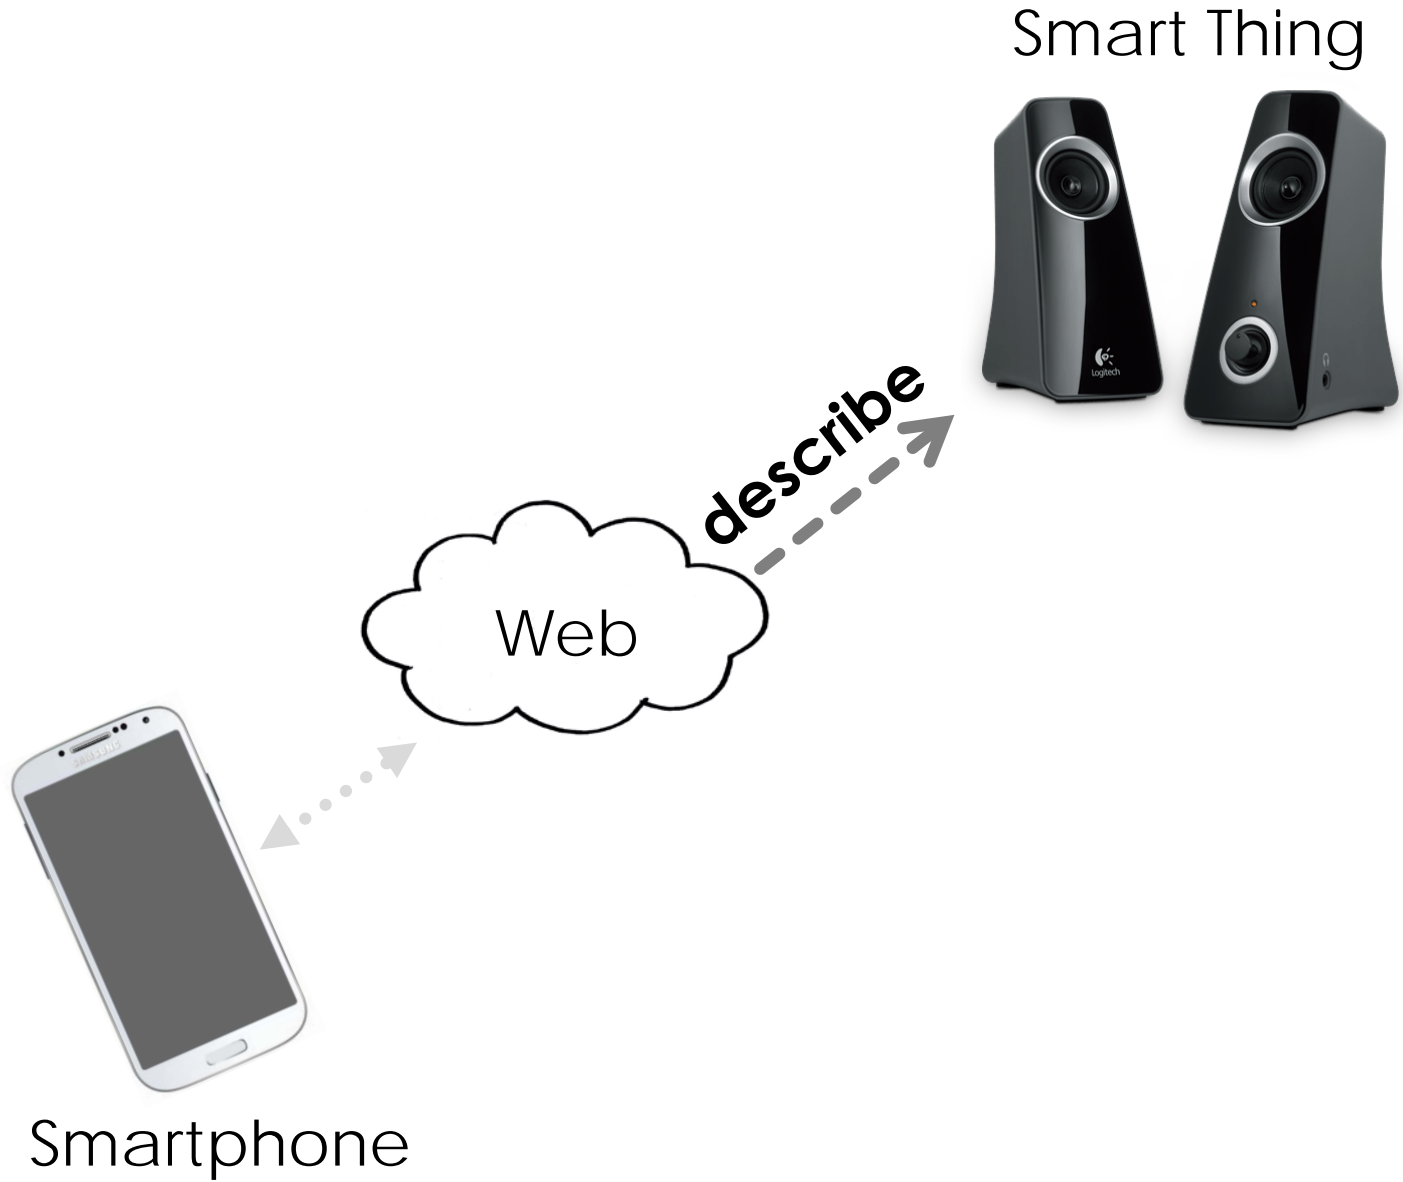

Interaction with Smart Things: Selection

- Glass: Same viewpoint as user!
- Visual object recognition
 - About 10 snapshots per device, can differentiate 8 devices
 - No tagging/fiducial markers required!
- Classification
 - SURF feature detection + description
 - Bag of Words + one binary SVM per device
 - About 80% per-frame accuracy

Interaction with Smart Things: Selection

Interaction with Smart Things: Interaction

```
1 <span itemscope itemprop="interaction">You can  
2   <span itemprop="name">scale</span> this resource within  
   a range of  
3   <span itemprop="type-range">[0,100]</span>  
4   <span itemprop="type-unit">percent</span> (values are  
   of type  
5   <span itemprop="type-name">int</span>).  
6 </span>
```

Human- and machine-readable volume controller interaction markup.

Reviewer Comments

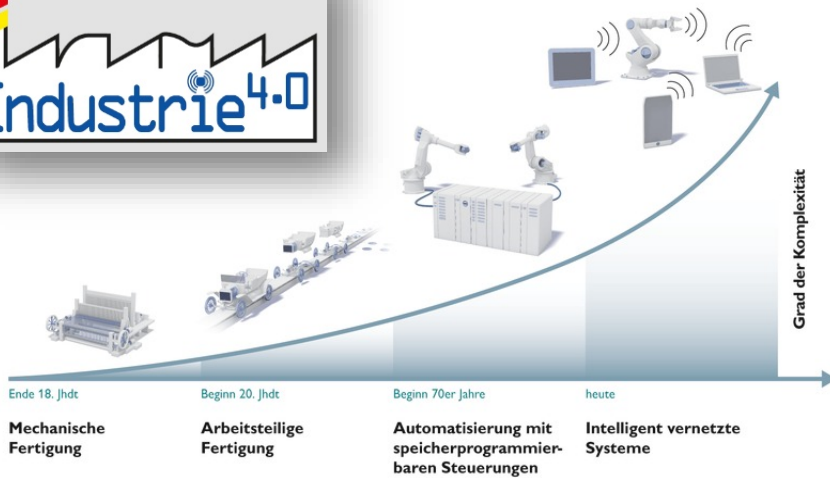

Why should I wear a smartphone, smartwatch, and smartglasses **just** to control my stereo set?

Our approach can help to do much more! Plus, you'll be wearing these devices in any case...

Industrie 4.0

Our approach can help to do much more! Plus, you'll be carrying these devices in any case ;-)

Why are you **rejecting** speech recognition as «cumbersome to use»?

Why is noone using it? Our guess is:
a) Non-perfect recognition
b) Privacy issues and embarrassment

«Beaming» is **not a new concept!**
How about Ubi-Finger, for instance.

We refer to the seamless transition of a UI
between two interaction devices as «Beaming»
UIDLs are much much older of course!

Limitations and potential problems
with the system could be discussed
more.

Indeed!

What if there are **6 devices** in the users field of view that can be controlled?

How about combining our idea with gesture recognition?

How about combining our idea with gesture recognition?

How about combining our idea with gesture recognition?

What about the **selection** phase?
80% frame on frame is not too
good, is it?

That's correct! Our experiments
with BRISK/SURF and ORB/SIFT
features look promising!

Can you really render user interfaces
for **every device** on this planet?

Perhaps not. However, we haven't
encountered a device that is not
covered by the UIDL...

What were your «legal problems»
with using Google Glass?

Well...

Limitations & Challenges

Objective	Limitations	Way out?
Select	<ul style="list-style-type: none">- Multi-object scenarios- Accuracy- Number of devices	<ul style="list-style-type: none">- e.g., gestures- e.g., better features- e.g., context-awareness
Describe	<ul style="list-style-type: none">- Descriptions must be provided	<ul style="list-style-type: none">- Simplify describing device interfaces
Interact	<ul style="list-style-type: none">- Legal issues	<ul style="list-style-type: none">- Get our own Glass...
